

# Rigour Without Infrastructure

A Standalone Scholar Methodology for Human–AI Knowledge Co-Production

glosa’s own paper: design, demonstration, and honest limits

Yaoharee Lahtee<sup>1</sup>

<sup>1</sup>Independent researcher / social-enterprise practitioner; Open Civil Science Initiative (standpoint in Section 1); ORCID 0009-0005-3861-0626

Draft of September 4, 2026 — genre: **DESIGN\_SCIENCE** (DSRM, Section 5) — venue\_track: none — k\_state: K0

## Abstract

People at the margins, frontline practitioners, and communities often know a problem before researchers do, because they live with it every day. Turning what they know into “knowledge” has historically run into walls of language, method, funding, institutions, and expertise. AI lowers those walls quickly, but a new problem follows: now anyone can produce text that looks smart and academic, without it being clear which part is evidence, which part is interpretation, and which part AI is smoothing over past what the data actually supports. This paper reports **glosa** (*Rigour Without Infrastructure*), a Standalone Scholar methodology for human–AI knowledge co-production: a person with no university, no lab, and no research team needs a mechanism that forces every claim to answer, for one claim at a time, what was actually seen, what the data separates, what AI filled in, what was assumed, and whether it has met independent evidence or objection. The paper is itself an instance of the method it describes: it is genre-routed as **design\_science** (Problem–Objectives–Design–Demonstration– Evaluation), reaches tier DR on its design claims and **FINITE\_DIAGNOSTIC** on one mechanically executed check (its own LaTeX build), and states plainly what was executed versus what remains specified. Its single most important limitation is structural, not incidental: every evidence relation behind its own ten claims is independence class *I0* (same-session self-read), so its own knowledge state is K0 by its own rule, not K1 — a reflexive finding, not an exception.

**Positioning.** We are not competing with knowledge-authority and make no priority claim; we state what we propose, what we build on, and what would make us wrong. (Verbatim, Lahtee and ANSE.ASIA session, fixer seat, 2026, §1.1; grounded in the founder’s own ruling: “*rao mai son reuang mai ... nen pai thi rao snoe arai gor por, phror rao mai dai kaeng khan khrai, lok phan chut nan pai laeo — pen yuk kan phalit ngan*” — “we are not interested in newness ... it is enough that we state what we propose, because we are not competing with anyone, the world has already moved past that point — this is an age of producing work” (founder ruling, request 31, romanized gloss; Thai script in `main_th.md`).)

## 1 Standpoint

This paper is written from the standpoint of a *social-enterprise practitioner and citizen* (the founder, Yaoharee Lahtee), not a substitute expert in computer science, philosophy of science, or library/information science. The AI collaborator (Claude, Anthropic, orchestrated under the “Fable” seat this session) drafted structure, prose, the ten claim cards in Section A, and the LaTeX build; it is disclosed throughout and is never treated as an

author (Section 12). This is disclaimer **D-STANDPOINT** (Section 10); mandatory in every genre (Section 5). **Disciplines not claimed:** medicine, religious/fiqh authority, law, engineering, anthropology, political science, formal computer science beyond what is mechanically executed here (disclosure D-NONEXPERT).

## 2 Question as lived / Question as readout / Hypothesis

### Question as lived

(th, verbatim, romanized gloss — see blackbox/DIALOGUE\_2026-09-04\_founder-fable\_DRAFT.md#L1; Thai script in Section B): “*khon thi mai mi mahawitthayalai, mai mi laep, lae mai mi thim wichai, ja phalit khwamru chak phuenthi khong ton eng yang khemkhaeng dai yangrai*” — “how can someone with no university, no lab, and no research team produce knowledge rigorously from their own site of practice?”

### Question as readout

Under the access this person actually has (their own site of practice, no institutional instrument, no credentialed lab, and now an AI collaborator with no standing of its own), what does an unaided narrative claim currently fail to separate from a claim that can be traced back to what was seen, what AI supplied, and what independent check it has met? The contaminated concept flagged here is “rigour” itself: as ordinarily used, it presupposes an institutional apparatus (a lab, a department, a review board) rather than naming a checkable property a claim can carry on its own.

### Hypothesis (H0, governing this paper)

If every claim is recorded as a claim card answering five founder questions bound to the Readout Condition’s Existence–Attribution–Disclosure norm, and gated by an independence ladder before any public release, **then** a person without institutional affiliation can produce human–AI co-produced knowledge whose rigour is checkable by a reader without relying on institutional credential as the licensing step. **Falsifier:** a real claim card that satisfies every field the kernel can check (schema-valid, presence-complete) while a genuinely independent (*I5*) reviewer finds the underlying licensing test or AI-fill disclosure false — showing the mechanical check does not track the epistemic property it names (Section 11).

*Hypothesis derived with Readout Universe — Yaoharee Lahtee (lens); co-produced by founder + Claude Sonnet (Fable orchestration seat); 2026-09-04. Lens DOIs: [Lahtee, 2026a,e]; lens repositories: [https://github.com/morrocowi/readout\\_universe](https://github.com/morrocowi/readout_universe), [https://github.com/morrocowi/readout\\_genesis](https://github.com/morrocowi/readout_genesis) (disclosure **D-LENS-UNCITED** — see Section 10: both DOIs and both repository URLs are named here, in the reference list, but no schema-conformant citation\_card with status: VERIFIED exists yet for either DOI in this repository as of this draft — the full lens-citation gate is therefore *not yet* mechanically closed; stated plainly rather than silently treated as satisfied). Blackbox Note line this section traces to: BB-2026-09-04-DRAFT#L1 (curated in Section B).*

### 3 Claim-tier legend

| Tag               | Meaning                                                                                                        |
|-------------------|----------------------------------------------------------------------------------------------------------------|
| TH_COQC           | Machine-checked, axiom-free formal result (e.g. Coq/Lean).                                                     |
| FINITE_DIAGNOSTIC | Measured or computed on a finite, retained, reproducible input; not a limit or population claim.               |
| FIT_CALIBRATED    | A model or heuristic calibrated against declared data; accuracy is conditional on that fit.                    |
| DR                | Declared bridge / human narrative synthesis; a design or interpretive judgment, not a proof or a measurement.  |
| DEFINITION        | A stipulated definition used only where it is decision-bearing (a gate, threshold, or rule), never decorative. |
| OPEN              | Not established. Named as a real open question, not smoothed over.                                             |

**Table 1:** RWI/glosa claim-tier legend (readout\_genesis + readout\_universe ladder).

Every claim this paper makes about *glosa itself* reaches at most DR, with exactly one exception: <sup>[C108]</sup> (this paper’s own LaTeX build actually compiling and containing zero forbidden words) reaches FINITE\_DIAGNOSTIC, because that specific fact was mechanically executed and is reproducible by re-running the same command (Section 9).

### 4 Introduction

A person with no university, no lab, and no research team can, today, ask an AI system to help them investigate a problem they live with, and receive back a fluent, structured, citation-shaped document. What that document does *not* come with, by default, is any mechanical way for a reader — or the author themselves, a week later — to tell which sentence rests on something actually observed, which rests on an assumption, which rests on the AI’s own training prior, and which has ever been checked by anyone other than the same session that produced it. **glosa** is a design response to exactly this gap: not a claim that rigour has been achieved, but a specification, partially demonstrated, of a mechanism (the claim card, Section 7) that makes those distinctions answerable in the first place. Every load-bearing claim in this introduction and below carries a claim-card id (<sup>[Cn]</sup>) resolving in Section A.

### 5 Genre and evidence standard

This paper is routed through glosa’s own genre router (design/FOUNDATION\_v0.4.md §6.3b) as `design_science` (row 7 of 9, §6.2): question 5 of the router’s ordered list — “did the author design and build an artifact (tool, protocol, template, system) as the contribution, rather than report on an existing situation?” — resolves yes before any later branch is reached, since glosa’s own claim cards, schemas, disclaimer catalogue, and templates are exactly such a built artifact. The genre’s DSRM structure (Problem → Objectives → Design → Demonstration → Evaluation → Communication) governs Sections 4 and 7 to 9; its claim ceiling is FINITE\_DIAGNOSTIC on “it runs” and DR on “it solves the problem well” — this paper claims the former only for its own compiled build (<sup>[C108]</sup>) and the latter, honestly, for everything else. `venue_track`: `none`: this is K0 work not yet headed to any venue (§6.1’s `none` value, added specifically so K0 work is not forced into a premature publication-track choice).

## 6 Related work

This section is descriptive comparison, not a priority contest (disclaimer **D-COMPARISON**, Section 10). It answers exactly three questions and no more.

**(1) Which problem we solve.** A person with no university, no lab, no research team needs to know, for one claim at a time, what licenses them to believe it (design/PLAN\_v0.1.md §0; design/FOUNDATION\_v0.4.md §1.1).

**(2) By which method.** A claim card answering five founder questions, tied mechanically to the Readout Condition’s Existence-Attribution-Disclosure norm, gated by an independence ladder (*I0–I5*) before anything is released, under a maker-checker-approver release gate (MIMCG) — design/FOUNDATION\_v0.4.md §§3–7 (Section 7).

**(3) Neighbour table.** Every row below is drawn from design/S13\_neighbour-table.md (30 tools audited, 2026-09-04). Every citation\_card cell is honestly PENDING — none of the neighbours audited has yet been converted into a schema-conformant, claim\_match\_verified citation card (disclosure **D-CITATION-UNVERIFIED**); rows are tiered OPEN on that basis, never upgraded on the strength of a fetched page alone, and rows marked NOT\_FETCHED are OPEN outright. No row below is written as “no tool does X.”

| Neighbour                                     | Problem they solve                                                    | Same as ours / different from ours                                                                                                                                                                                                     | Fetches/verified             |
|-----------------------------------------------|-----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| Elicit (elicit.com)                           | Literature screening/extraction at scale, sentence-level citations    | Same: attaches a citation to a generated claim. Different: Elicit’s unit is the sentence; ours is the claim-distinction, carried with a typed independence tier and a tier-ceiling rule.                                               | domain-only, read 2026-09-04 |
| Consensus (consensus.app)                     | Machine-computed agreement signal over a body of literature           | Same: a machine-computed signal over literature. Different: Consensus’s meter relies on journal peer review as its filter; our tier does not treat agreement or peer-review status as a legitimacy lever.                              | domain-only, read 2026-09-04 |
| Nanopublications (nanopub.net)                | Packaging a single assertion as a citable, provenance-carrying object | Same: both operate at single-assertion grain, the closest confirmed real neighbour found. Different: no confirmed typed AI-vs-human disclosure field, independence-ladder/tier concept, or source-licensing check on the page fetched. | domain-only, read 2026-09-04 |
| Zotero / Paperpile                            | Reference capture and bibliography management                         | Same: used as our own source-ledger substrate, not competed against. Different: neither operates at claim level or discloses AI content.                                                                                               | domain-only, read 2026-09-04 |
| CITATION.cff (citation-file-format.github.io) | Machine-readable software/dataset citation metadata                   | Same: this is the exact file glosa itself uses for release metadata. Different: no confirmed typed AI-contributor field.                                                                                                               | domain-only, read 2026-09-04 |
| IMRAD (UNC Writing Center)                    | Structuring an empirical report                                       | Same: used where a real access event exists. Different: glosa’s contribution is the explicit rule for <i>which</i> genres IMRAD fits (§6.3) versus which need a different structure — not a rediscovery of IMRAD itself.               | domain-only, read 2026-09-04 |

**Table 2:** Neighbour table (6 of 30 audited rows shown; full table design/S13\_neighbour-table.md). Descriptive comparison only (Section 10 D-COMPARISON). <sup>[C104]</sup>.

## 7 Method / mechanism

Per the design\_science genre (Section 5), this section names the mechanism and cites its owning specification and protocol cards by path — it does not restate their content (one-fact-one-home, design/FOUNDATION\_v0.4.md §8).

**The spine (round trip)**

Problem → experience → readout-lens translation → academic hypothesis → rigorous method → paper → Zenodo/GitHub. design/FOUNDATION\_v0.4.md §2; methodology/P00\_lens.md, P01\_standpoint.md, P02\_intake.md. [C101]

**The claim card**

The atomic unit: statement, standpoint, five questions ↔ E-A-D, in one of two legal shapes (stub/full). design/FOUNDATION\_v0.4.md §3; methodology/P03\_claim\_card.md; schema/claim\_card.schema.json. [C101]

**The Independence Ladder**

I0–I5, tier ceilings, maker ≠ checker ≠ approver (MIMCG). design/FOUNDATION\_v0.4.md §4.2, §7.1–7.2; methodology/P06\_independent\_check.md. [C102]

**The disclaimer catalogue**

One master, typed, enumerable table with machine-testable trigger conditions. design/FOUNDATION\_v0.4.md §5; methodology/data/disclaimer\_catalogue.json. [C107]

**The genre router**

Nine ordered questions over named claim-card fields, yielding one genre id or MIXED\_GENRE. design/FOUNDATION\_v0.4.md §6, §6.3b; methodology/data/genre\_router\_table.json. *Honest edge*: §6.3b’s own text names the narrating card methodology/P13\_genre\_router.md; this session’s own read of methodology/ found P13\_literature\_review.md occupying that slot instead (methodology/README.md’s own table already flags this numbering variance) — no narrating card for the genre router currently exists under either name; the data file does. [C103]

**Gates and release**

MIMCG L0–L5, PUB-ADVERSARIAL-REVIEW (R1–R7), the release state machine. design/FOUNDATION\_v0.4.md §7; methodology/P10\_publish\_gate.md.

**Literature Review System (LRS)**

Six gated stages (question framing → search → acquisition → extraction → citation verification → manifest freeze), one run per hypothesis, two manifest gates (accuracy, diversity). design/FOUNDATION\_v0.4.md §7.9; design/S14\_literature-review-system.md; methodology/P13\_literature\_review.md. [C109]

**Callable layer**

schemas → kernel → CLI → MCP → plugin, stdlib-only, offline. design/FOUNDATION\_v0.4.md §9; kernel/, cli/, mcp/. *Honest edge*: none of kernel/’s named functions (validate\_claim\_card, gate\_release, route\_genre, ...) were executed against this paper’s own ten claim cards in this session — only direct jsonschema structural validation was (Section 9).

**8 Demonstration**

The spine’s full round trip is demonstrated, once, on a real (if low-stakes) problem in cases/worked-example-cat.md: a founder-supplied question (romanized gloss: “*thammai maeo yiao mai pen thi*”, “why does the cat not urinate in [the designated] place”) is (i) recorded verbatim in a Blackbox Note; (ii) translated into readout vocabulary (Lens Law:  $Q, X, R, \Phi$ , formal\_applicability); (iii) analysed as four rivals — illness, dirty/aversive box, household stress, territorial marking — sitting in one currently indistinguishable fiber, each requiring a different access augmentation to separate; (iv) translated back into two world-language hypotheses (H1 box-condition, H2 marking) each with a named falsifier, with the medical rival handed off to a veterinarian rather than resolved by AI reasoning; (v) run through an LRS stub for H1, whose litreview\_manifest.gate.overall comes back PENDING/FAIL *honestly*, because zero sources were actually fetched; (vi) genre-routed, by the ordered procedure of Section 5, to case\_study — not the infor-

mal `empirical_qual_practice` label used earlier in the same session, recorded as a discrepancy rather than silently corrected to match the earlier framing; and (vii) recorded as a stub claim card at tier: `Dr, k_state: K0, every route at independence_class: I0.` <sup>[C105]</sup> The demonstration’s own value is negative evidence stated positively: it shows the gate *refusing* to pass an under-evidenced literature review, not a completed literature review. <sup>[C109]</sup>

## 9 Evaluation

Per the `design_science` genre’s own evaluation obligation, this section states exactly what was executed in the session that produced this paper, versus what remains specified prose — no rounding either direction.

### Executed, with results:

- **LaTeX build.** This file (`paper/latex/main.tex`), copied from `templates/paper/arxiv-onecol/` and filled with this paper’s content, was compiled with `pdflatex` (twice) and `bibtex`, then the resulting PDF was scanned with `pdftotext` piped through `grep` for every term on the repository’s own forbidden-comparison-word list (`AGENTS.md` gate rule 6 — terms describing priority or precedence for a piece of work, listed there and in this paper’s own front-matter guidance, deliberately not re-typed inside this compiled document so the scan is never confounded by its own description of itself). **Exact result: 0 occurrences of any listed term, outside this sentence’s own description of the check** — see `paper/README.md §Evaluation` for the literal command and output. <sup>[C108]</sup>, tier `FINITE_DIAGNOSTIC` for this specific fact (an executed, reproducible mechanical check, independence class *I4*).
- **Claim-card schema validation.** All ten claim cards in `paper/claims/GLOSA-CC-20260904-01{01..10}.yaml` were validated in this session against `schema/claim_card.schema.json` using `jsonschema’s Draft7Validator` (Python 3.13, `jsonschema` 3.2.0) with a local resolver over every file in `schema/`. **Result: 10/10 passed with zero validation errors** — reported in full in `paper/README.md`. This checks field *presence* and *shape* only (chair ruling D2); it does not and cannot check the *content* of any field for correctness.
- **File-count spot-checks.** `reviews/` in this checkout contains **2** files (`FOUNDATION_v0.2_anchor.md`, `FOUNDATION_v0.2_usability.md`), not the “28 reviews” `design/FOUNDATION_v0.4.md §12`’s own narrative describes as read into its synthesis; `design/` contains 12 files, not a full S1–S13 staged set. This is reported as an observed discrepancy in this checkout, tier `FINITE_DIAGNOSTIC` for the `ls` count itself, `OPEN` for where the other files are (a different session, branch, or worktree is the most likely explanation, not independently confirmed here) — consistent with the readout-not-truth obligation to verify before repeating a prior document’s own count rather than restate it as this session’s own finding.

**Specified only, not executed this session:** `kernel/’s validator/gate` functions against real data; the genre router as running code; `compute_disclaimers()`; `gate_release()`; any DVP cross-vendor review pass on this paper or on `FOUNDATION_v0.4.md` itself; any LRS run for this paper’s own related-work section (which is a neighbour-table comparison, not a frozen `litreview_manifest` — by §6.4’s own rule, this means this paper’s own related-work section has *not* cleared the gate it itself describes, named plainly here rather than silently exempted, <sup>[C110]</sup>); any I2+ independent review of this paper or of `FOUNDATION_v0.4.md`. Nothing else was executed.

## 10 Limitations

This section is the rendered disclaimer catalogue, not ad hoc prose. Every item below must be filled in; an item with nothing to disclose is stated as *none identified*, never omitted.

### D-STANDPOINT

See Section 1: founder = social-enterprise practitioner and citizen, not a credentialed expert in the

disciplines this paper touches; AI = drafting assistant, disclosed throughout, never an author.

#### D-NONEXPERT

Disciplines this paper draws on: applied epistemology/provenance design, software specification, LaTeX/document engineering. Disciplines explicitly *not* claimed: medicine, religious/fiqh authority, law, engineering, anthropology, political science, formal computer science beyond the mechanically executed checks in Section 9.

#### D-SCOPE

Not applicable to EMPIRICAL genre thresholds (this is `design_science`); the one  $n=1$  demonstration this paper reports (Section 8) is explicitly scoped to a single worked example, one household, one cat, and is never generalized past that (D-SCOPE( $n=1$ ), matching the cat worked example’s own wording).

#### D-NONCLAIM

This paper does *not* claim: that glosa’s kernel/CLI/MCP layer exists as running code (Section 9); that any claim card in this repository, including its own ten, has passed an independent ( $I2+$ ) check; that the cat worked example demonstrates the method works for problems of any other shape or stakes; that any neighbour-table row’s capabilities were independently re-verified beyond a single fetched page; that this paper is ready for any venue or is peer reviewed in any sense.

#### D-AIFILL

See Section 12. AI drafted: this document’s prose throughout, all ten claim cards in Section A, the LaTeX build, the Blackbox Note line selection in Section B (candidate only, `ai_proposed: true`), and the neighbour-table excerpt in Section 6. Founder-authored/decided: the underlying methodology’s direction (prior sessions, `design/FOUNDATION_v0.4.md`), every Blackbox Note line’s original content, and the standpoint declaration. Not yet founder-reviewed: this specific draft’s wording and claim selection (Section D).

#### D-TIER

Highest tier claimed anywhere in this paper: `FINITE_DIAGNOSTIC` (<sup>[C108]</sup>, the LaTeX build’s own compile-and-grep result — a real, reproducible, executed check). It cannot go higher (e.g. to `TH_COQC`) because no formal, machine-checked proof is offered anywhere in this paper; every other claim is DR because it is a design/interpretive judgment about glosa’s own specification, not a proof or an independently repeated measurement.

#### D-INDEPENDENCE

Every claim in Section A except <sup>[C108]</sup> carries exactly one evidence relation, at independence class  $I0$  (same-session self-read — not a `tested:` entry at all per §4.2’s own table). <sup>[C108]</sup> additionally carries one  $I4$  (mechanical/executed) evidence relation, the compile-and-grep result itself. This paper does not seek, and does not treat as available, any external or institutional validation as a lever that would make its claims more true on its own say-so.

#### D-DVP-NOT-K2

No claim in this paper is asserted above  $K1$ , and in fact none reaches even  $K1$ : this paper’s own `k_state` is  $K0$  throughout (Section C), since no evidence relation anywhere in it reaches  $I3$  (cross-vendor AI) or  $I5$  (external human). **DVP**  $\neq$  **K2** applies with extra force here: no DVP pass of any kind has even been run yet.

#### D-SAME-VENDOR

Not applicable in the sense the id names (no Route Dependence Matrix with  $I1/I2$ -only routes was built for this paper) — but the underlying condition it guards against is present in a stronger form: every route here is the *same session*, not merely the same vendor ( $I0$ , not  $I2$ ). Named plainly rather than marked “none identified,” since the id’s spirit (same-source concentration) clearly applies even though its literal Route Dependence Matrix trigger was never built.

#### D-LEGAL-NEQ-EPISTEMIC

None identified: no license, permit, certification, or regulatory approval is cited by any claim in this paper

as raising its epistemic warrant. (CC BY 4.0 governs this repository’s reuse rights only, per LICENSE; it certifies nothing about any claim’s truth.)

#### **D-NOT-DIAGNOSTIC**

Applicable: Section 8 discusses a health-adjacent rival (possible feline illness) as part of the worked example. This paper makes *no* veterinary, medical, or treatment recommendation; the medical rival is explicitly handed off to a veterinarian in the underlying worked example (cases/worked-example-cat.md Step 2) and is never resolved here.

#### **D-TRANSLATION**

Applicable: a Thai companion exists (../main\_th.md, source of truth) and this English document (../main\_en.md / this LaTeX build) is a rewrite of meaning, never a word-for-word translation, per record (translation\_status: reviewed on the underlying claim cards). Quoted Blackbox Note lines in Section B are romanized-glossed in this LaTeX build specifically because this TeX installation has no configured Thai font — the Thai script itself is never altered and lives in ../main\_th.md and the underlying dialogue file.

#### **D-DISSENT-PRESERVED**

None recorded to date for this paper specifically. glosa’s own design history records several resolved disputes (design/FOUNDATION\_v0.4.md §10, six disputes resolved by chair ruling, explicitly flagged as overturnable by the founder) — none of those disputes bears directly on this paper’s own ten claims.

#### **D-COMPARISON**

This paper does not claim priority or precedence over other work. Section 6 answers exactly three questions — which problem this paper solves, by which method, and how the nearest neighbours do it the same or differently (Table 2) — and every neighbour relation is stated as *same*, *different*, or *cited*, never as a priority contest.

#### **D-CITATION-UNVERIFIED**

Applicable throughout Section 6: every neighbour-table citation carries citation\_card: PENDING (not yet a schema-conformant, verified object); every row is tiered OPEN on that basis. The two lens DOIs ([Lahtee, 2026a,e]) are likewise not yet backed by a status: VERIFIED citation card in this repository, which is why **D-LENS-UNCITED** (below) is stated as not yet fully closed.

#### **D-LENS-UNCITED**

lens\_used is present in this paper’s own front matter (Section 2) and in every one of its ten claim cards. Both required DOIs (10.5281/zenodo.21529456, 10.5281/zenodo.21665100) and both repository URLs ([https://github.com/morrocwi/readout\\_universe](https://github.com/morrocwi/readout_universe), [https://github.com/morrocwi/readout\\_genesis](https://github.com/morrocwi/readout_genesis)) are present in this paper’s own reference list and front matter — satisfying half of §7.4’s rule (presence in the document). The other half (a status: VERIFIED citation\_card object for either DOI) does not yet exist anywhere in this repository as of this draft. Per §7.4’s own text, this is a **hard release-gate block**, not a soft disclaimer-and-proceed: this paper, as it stands, cannot legally clear its own release gate.

#### **D-LENS-UNSIGNED**

Not triggered: every claim card’s hypothesis\_world.signature is non-empty and names the lens lens\_ref points at (“Hypothesis derived with Readout Universe — Yaoharee Lahtee (lens); co-produced by founder + Claude Sonnet ...”), satisfying §3.3 rule 12 as specified.

#### **D-LIT-MODE**

Applicable to Section 8’s LRS stub: its search\_log.search\_mode is honestly TARGETED\_SEARCH, not SYSTEMATIC\_REVIEW, and this is stated next to the demonstration itself, not in a methods footnote.

#### **D-LIT-NOT-OBTAINED**

Applicable: the LRS stub in the underlying worked example lists zero sources\_found — nothing is named as known-but-unread, because no search was actually run (it is a stub, disclosed as such).

**D-K-STATE**

This paper’s overall knowledge state is K0 (Section C); no per-claim exception raises the paper’s own state, though one fact within it (<sup>[C108]</sup>) is independently tiered `FINITE_DIAGNOSTIC/I4`.

**D-AUTHORSHIP**

See Section 12. The founder (Yaoharee Lahtee) is the sole formal author; AI contribution is disclosed per claim (`produced_by: joint` on every card in Section A) and never substitutes for the founder’s own judgment or responsibility.

**D-NO-VERTICAL-AUTHORITY**

This paper does not seek, and would not treat as raising any claim’s warrant, peer review, publication venue acceptance, or institutional recognition — consistent with `CLAIM_BOUNDARY.md` and `AGENTS.md` gate rule 6. Its own unreviewed status (Section D) is stated as an honest gap, not something outside validation would fix.

**D-CANDIDATE-STATUS**

Every artifact this paper names — its own ten claim cards, this LaTeX build, the Blackbox Note selection — is `status: Draft`, none has passed an *I4/I5* check beyond the one mechanical LaTeX-build fact (<sup>[C108]</sup>).

**D-PARTIAL-SET**

Not triggered by a 3-lane structure in this paper specifically; named here as “none identified” for completeness rather than omitted.

**D-SILENT-LIFT-GUARD**

Applicable to <sup>[C101]</sup>: this paper’s own drafting session assumed, without independently re-deriving, that `design/FOUNDATION_v0.4.md`’s cited text is the founder’s currently-binding intent (`assumed[] .id: A1` on every claim card).

**D-BLACKBOX-NOTE**

This paper carries the mandatory Blackbox Note appendix (Section B, “how this work was made”): curated verbatim human lines and the cooking log of every transformation applied to them. Blackbox id: `BB-2026-09-04-DRAFT` (`blackbox/DIALOGUE_2026-09-04_founder-fable_DRAFT.md`); the curated selection in Section B is *AI-proposed* only and awaits founder approval (Section 12).

**D-NO-EPISTEMIC-VETO**

Always on: no agency (the founder, this AI, a future reviewer, or any other party) holds an epistemic veto over this paper’s claims merely by title, credential, or institutional position; any agency may propose/use/test/challenge/fork/translate/revise/ restrict/withdraw a claim card here without needing permission, provided lineage is preserved.

**D-DERIVED-PATTERNS**

Applicable: this paper’s method (Section 7) re-derives patterns from private ANSE.ASIA repositories/skills not themselves public — the maker-checker-gate (MIMCG) L0–L5 table and MC-01–05 rules, and the `grr-epistemic-foundation` Claim/Evidence/Warrant vocabulary pattern (not its literal enum strings). See `lineage/RELATION_TO_ANSE_SKILLS.md` for the full ledger; not restated here.

**11 What would make us wrong**

Restated from `CLAIM_BOUNDARY.md` and this paper’s own ten claim cards (Section A), as a single list rather than scattered through the text:

- A real claim card that satisfies every field the kernel can check (schema-valid, presence-complete per Section 9) while a genuinely independent (*I5*) human reviewer finds the underlying licensing test (Q2) or the AI-fill disclosure (Q3) false. <sup>[C101]</sup>
- A real claim-card payload that validates against `schema/claim_card.schema.json` with `k_state: K2`

- or K3 and zero *I5* evidence relations. <sup>[C102]</sup>
- Two independent readers running §6.3b’s ordered procedure against the same claim card and reaching two different, non-MIXED\_GENRE results. <sup>[C103]</sup>
- Any row of `design/S13_neighbour-table.md` found, on re-audit, to claim priority or precedence for glosa over a neighbour, or to describe an unattributed adoption from one, without a named human-instructed-adoption record (a Blackbox Note line or `DECISIONS.yaml` row). <sup>[C104]</sup>
- A re-run of the cat worked example, under the same stated access constraints, reaching `gate.overall: PASS` or a *k\_state* above K0 with no new fetched, claim-match-verified source. <sup>[C105]</sup>
- A real release-gate run returning PASS for a genre-routed paper whose Blackbox Note appendix is empty or absent. <sup>[C106]</sup>
- Any mandatory-per-§6.4 disclaimer id found missing from this paper’s own rendered Section 10. <sup>[C107]</sup>
- A `pdflatex/bibtex` run on this file that fails to produce a PDF, or a `pdftotext | grep` scan of a produced PDF returning a nonzero forbidden-word count. <sup>[C108]</sup>
- A `litreview_manifest` with zero VERIFIED citations whose `gate.overall` nonetheless reads PASS/PASS\_WITH\_LIMITS in a real run. <sup>[C109]</sup>
- This paper, or any of its ten claims, described anywhere as K1 or higher, or as “peer reviewed”/“verified,” before an *I3+* or *I5* evidence relation has actually been added to the relevant card. <sup>[C110]</sup>

## 12 AI-assistance disclosure

This paper is a human–AI co-production (disclaimer **D-AUTHORSHIP**, Section 10), not AI-only automation and not human-only authorship. Generative AI (Claude, Anthropic, Sonnet model, orchestrated under a “Fable” seat this session) assisted with: drafting this document’s prose end to end from the founder’s own FOUNDATION/PLAN specification and Blackbox Note lines; drafting all ten claim cards (Section A) and running their schema validation; filling and compiling this LaTeX template; selecting which Blackbox Note lines to curate into Section B; and drafting the neighbour-table excerpt in Section 6 from `design/S13_neighbour-table.md`. Per the route-level disclosure standard [Lahtee, 2026e]: **AI output is not treated as evidence**. Every claim above is accepted only when it matches a retained source record (a named file, section, or executed command) described in the Claim Matrix (Section A), which records, per claim, who produced it and who is responsible (`produced_by`, `responsible`). The founder holds the standpoint, the direction and core ideas of the whole glosa methodology, the falsifier judgment on every claim, the selection of which Blackbox Note lines become public, and the final public commitment (nothing in this repository has yet been released publicly); AI’s role was assistive throughout — exploration, drafting, structuring, mechanical checks (schema validation, LaTeX compilation), and logging — never substitutive for the founder’s own judgment, standpoint, or final commitment (Human Mastery Gate, Section D; **AIContribution** ≠ **EpistemicResponsibility**). The founder has not yet reviewed this specific draft line by line; that review, and the Human Mastery Gate decision, remain open (Section D).

## 13 Conclusion

glosa specifies, and partially demonstrates on one real worked example, a mechanism for making a claim’s rigour checkable without institutional standing: a claim card bound to the Readout Condition’s E-A-D norm, gated by an independence ladder that this paper’s own schema-level check confirms cannot mechanically reach *K2* from *I0–I4* routes alone. Applied reflexively to itself, the same mechanism reports that this paper is *K0*, not *K1* — every one of its own ten claims rests on a same-session self-read, and its own related-work section has not cleared the literature-review gate it describes. That is offered as the paper’s own honest starting condition, not as a result it has yet earned.

## A Claim matrix

Every claim-card id referenced above (<sup>[Cn]</sup>) resolves to exactly one row in `paper/CLAIM_MATRIX.md` (full table, ten claims C101–C110, not reproduced a second time here to avoid a driftable copy — one-fact-one-home). Each row’s full claim card (every field, not this print compression) lives at `paper/claims/GLOSA-CC-20260904-0<nnn>.yaml`. Per Chair Ruling v1 §B2, the matrix is a print-space compression of the full claim card (`shape: full`); it is not the record of correctness itself — field-presence is mechanically checkable (Section 9), the content’s correctness is what an independent check (Q5) exists for and has not yet run for any of these ten claims.

## B Blackbox Note: how this work was made

(*Thai project term: “Bantuek Klong Dam” / the black-box note.*) This appendix is mandatory (disclaimer **D-BLACKBOX-NOTE**, `design/FOUNDATION_v0.4.md` §2.4/§6.4). It is a **curated** subset of the raw human voice record that produced this paper’s claims — selected by the AI as *candidate* lines only (`ai_proposed: true` on every row below — **the founder has not yet approved this selection**), verbatim (typos kept, romanized- glossed here since this build has no Thai font; Thai script is the source of truth in `blackbox/DIALOGUE_2026-09-04_founder-fable_DRAFT.md` and `main_th.md`) — followed by the cooking log of the transformations this session applied to them. Full record: `blackbox/DIALOGUE_2026-09-04_founder-fable_DRAFT.md` (36 founder lines; the AI’s own replies remain in the session transcript, not reproduced here).

| this paper (R1) | joint                                       | FOUNDATION_v0.4 and <code>main_th.md</code> , <code>main_en.md</code> , this LaTeX build, ten claim cards, and this Blackbox Note S13, S14, appendix; human review of this specific draft has not yet occurred. |                                                                                                                                                                                                                                                                             |

**Table 4:** Cooking log (Thai project term: “karn pung”) — append-only, every transformation kept.

## C Knowledge state

This paper’s overall knowledge state is K0 (internal working note; not yet reviewed, not yet released outside this repository) — with no per-claim exception: all ten claims in Section A share the same K0/I0 state (disclaimer **D-K-STATE**). One fact is stronger than K0 in a narrow, named sense without changing the paper’s overall state: <sup>[C108]</sup>’s specific mechanical result (the LaTeX build compiling; the grep count) is tier FINITE\_DIAGNOSTIC at independence class I4 — a real, reproducible, executed check — but a single FINITE\_DIAGNOSTIC/I4 fact about the build does not raise the *paper’s k\_state*, which remains gated on its actual claims about glosa’s mechanisms, all still I0.

## D Human Mastery Gate

Gate status: **NOT READY** — the founder has not yet read this specific draft line by line or exercised the ten-item mastery checklist against it (adapted from the Standalone Scholar Human Mastery Gate). This is stated plainly rather than defaulted to a pass, consistent with Section 12’s own statement that the founder’s review of this draft remains open.

## E Provenance and lineage

This paper is positioned relative to prior work per the anchor-preservation protocol (status vocabulary: PRESERVE\_EXACT, PRESERVE\_FUNCTION, EXPAND, SUPERSEDE); full table: `lineage/RELATION_TO_STANDALONE`, `lineage/RELATION_TO_READOUT_CONDITION.md`, `lineage/PRIOR_WORK.md`. Direct ancestor: Lahtee [2026d]. Core epistemic engine this paper’s provenance apparatus is built on: Lahtee [2026c]. Reflexive citation (`design/FOUNDATION_v0.4.md` §7.4): this paper represents itself as following the glosa/Rigour Without Infrastructure method and so must itself carry glosa’s own repository reference. As of this draft, `CITATION.cff` (updated elsewhere in this same working session, not by this paper’s own drafting) names a reserved Zenodo DOI (10.5281/zenodo.22301060, concept DOI 10.5281/zenodo.22301059) and repository-code: `https://github.com/morrocwi/glosa` [Lahtee, 2026b]. This session did *not* independently confirm, over the network, that either the GitHub repository or the Zenodo record is actually live and public — `git remote -v` in this working tree returns no configured remote, and `.zenodo.json` has not yet been updated to carry the same DOI `CITATION.cff` now names. This cross-file gap is flagged, per glosa’s own triple-consistency check (`CITATION.cff/.zenodo.json/codemeta.json`, PRESERVE\_EXACT lineage from zero-readout-certifies), as an open item rather than silently treated as resolved.

Repository `https://github.com/morrocwi/glosa`; Zenodo DOI reserved per `CITATION.cff` (concept DOI 10.5281/zenodo.22301059), 2026b. Reflexive self-citation (`design/FOUNDATION_v0.4.md` §7.4). This session did not independently confirm the GitHub repository or the Zenodo record are live and public; `.zenodo.json` has not yet been updated to match `CITATION.cff`’s reserved DOI as of this draft.
- Yaoharee Lahtee. The readout condition: Existence, attribution, and disclosure norms for claim-level provenance, 2026c. Draft manuscript, `sources/READOUT_CONDITION_2026-08.txt` (2026-09-04 checkout); Zenodo DOI not yet confirmed as of this template’s Dr-tier draft – update once assigned. Core E–A–D engine this template’s disclosure apparatus is built on.
- Yaoharee Lahtee. The standalone scholar: A dual-track architecture for ai-native scholarship. Zenodo, 2026d. Direct ancestor of the RWI methodology (macro K0–K3/DVP architecture); see `lineage/RELATION_TO_STANDALONE_SCHOLAR.md`.
- Yaoharee Lahtee. What a zero readout certifies. Zenodo, 2026e. Source of the CLAIM\_MATRIX and AI-assistance-disclosure boilerplate reused in Section 12.
- Yaoharee Lahtee and ANSE.ASIA session, fixer seat. Rigour without infrastructure — foundation v0.4 (glosa design document). Local repository, `design/FOUNDATION_v0.4.md`, not yet on Zenodo/GitHub (K0, local Forgejo only), 2026. The specification this paper implements; itself unreviewed (tier Dr), per its own §12. Cited by file path, not DOI, since none exists yet.
