

Rigour Without Infrastructure

A Standalone Scholar Methodology for Human–AI Knowledge Co-Production

Yaoharee Lahtee¹

¹Independent researcher / social enterprise practitioner (standpoint in Section 1)

Draft of September 4, 2026 — genre: [FILL: CONCEPTUAL / EMPIRICAL / FORMAL_PROOF / CASE_STUDY / ARCHIVAL_DOCUMENTARY / DESIGN_SCIENCE_ARTIFACT / PRACTICE_REPORT, see Section 5]

Abstract

[FILL: 150–250 words. State the phenomenon or problem, the precise inadequacy in existing explanations/tools, the mechanism or method this paper contributes, the claim ceiling this paper reaches (name the tier, Section 3), and the single most important limitation. Do not use the abstract to claim a tier the body does not support.]

Positioning. We are not competing with knowledge-authority and make no priority claim; we state what we propose, what we build on, and what would make us wrong.

1 Standpoint

This paper is written from the standpoint of [FILL: e.g., *a social-enterprise practitioner and citizen, not a substitute expert in the discipline the paper touches*]. The standpoint is declared here, once, and governs how every claim below should be read: findings are offered from this position and at this access level, not from institutional authority or disciplinary credential. This is disclaimer **D-STANDPOINT** in Section 9; it is mandatory in every genre (Section 5). **Disciplines not claimed:** [FILL: name the disciplines this paper's standpoint does *not* extend competence into — e.g. *clinical medicine, law, formal mathematics beyond what is machine-checked here*. This list is disclosure D-NONEXPERT (Section 9) and must not be left as "none"; every paper touches at least one discipline it does not have standing in.]

2 Question as lived / Question as readout / Hypothesis

This section is the round-trip translation the paper's claims are built on (readout-then-world-language, never the reverse): the problem as it was met, the same problem re-stated in the readout vocabulary, and the world-language hypothesis extracted from that readout analysis.

Question as lived

[FILL: the human-language question exactly as first asked, verbatim, with a language tag, e.g. (*th*) or (*en*). Do not polish it into academic register here.]

Question as readout

[FILL: the same question translated into the declared readout vocabulary — access source, what that source distinguishes, what it does not (same-fiber) distinguish, and any contaminated concept it hides.]

Hypothesis

[FILL: the world-language hypothesis extracted from the readout analysis, plus its falsifier — what observation would make this paper wrong.]

Blackbox Note line(s) this section traces to: [FILL: BB-YYYY-MM-DD-NN line number(s), see Section B].

3 Claim-tier legend

Every claim in this paper (main text, tables, appendices) carries exactly one tier tag. Tiers are never collapsed and never silently upgraded between drafts; a tier change is a logged decision (see Section E).

Tag	Meaning
TH_COQC	Machine-checked, axiom-free formal result (e.g. Coq/Lean).
FINITE_DIAGNOSTIC	Measured or computed on a finite, retained, reproducible input; not a limit or population claim.
FIT_CALIBRATED	A model or heuristic calibrated against declared data; accuracy is conditional on that fit.
DR	Declared bridge / human narrative synthesis; a design or interpretive judgment, not a proof or a measurement.
DEFINITION	A stipulated definition used only where it is decision-bearing (a gate, threshold, or rule), never decorative.
OPEN	Not established. Named as a real open question, not smoothed over.

Table 1: RWI claim-tier legend (readout_genesis + readout_universe ladder).

4 Introduction

[FILL: phenomenon/problem statement. Ground the motivating question in the founder’s own framing where applicable: *a person with no university, no lab, and no research team — how can they produce knowledge from their own site of practice, rigorously?* Every load-bearing factual claim in this section must carry a claim-card id ^[Cn] resolving in the Claim Matrix, Section A.]

5 Genre and evidence standard

This paper is routed through the RWI genre router (design/S5, §2) as [FILL: **GENRE NAME**]. State here: the router question(s) that selected this genre, the required sections that follow from it, its evidence standard, and its claim ceiling for this paper (Table 1). If more than one genre applies to different sections, name the governing (tightest) ceiling and mark the mixed sections explicitly (MIXED_GENRE).

6 Related work

This section is descriptive comparison, not a priority contest (disclaimer **D-COMPARISON**, Section 9). It answers exactly three questions and no more: which problem this paper solves, by which method, and how the nearest neighbours do it the same or differently. Wording rule: say *same* / *different* / *cited* for every neighbour relation; never as a claim of priority, precedence, or being without a predecessor. "Adopted from" is written only where a human explicitly instructed the adoption and a Blackbox Note line or decision id names it.

(1) Which problem we solve. [FILL: one paragraph, plain statement, no comparison yet.]

(2) By which method. [FILL: one paragraph naming the mechanism or method from Section 7, at the level of detail needed to compare against neighbours below.]

(3) Neighbour table. Every row needs a citation card id (source card / citation-accuracy subsystem) with `metadata_verified` and `claim_match_verified`; a row without a fetched, verified citation is tiered OPEN (Section 9, D-CITATION-UNVERIFIED), never written as "no tool does X".

Neighbour	Problem they solve	Their method	Same as ours	Different from ours	Citation card	Fetched/verified
Schaffer [2005]	[FILL]	[FILL]	[FILL]	[FILL]	[FILL]	[FILL]
Jaakkola [2020]	[FILL]	[FILL]	[FILL]	[FILL]	[FILL]	[FILL]

Table 2: Neighbour table (descriptive comparison only; Section 9 D-COMPARISON). Format after `templates/knowledge/neighbour_table.md`.

7 Method / mechanism

[FILL: per the genre selected in Section 5 — the mechanism (conceptual), the design and analysis plan (empirical), the claim-to-theorem map (formal/proof), the case protocol (case study), the acquisition/retention protocol (archival), the artifact build-and-evaluate loop (design-science), or the operating context and what was actually done (practice report).]

8 Findings / propositions

[FILL: propositions or findings, each tagged with a tier (Table 1) and a claim-card id ^[Cn]. State for each one what would defeat it (a named falsifier), per the independent-evidence discipline in D-INDEPENDENCE.]

9 Limitations

This section is the rendered disclaimer catalogue, not ad hoc prose. Every item below must be filled in; an item with nothing to disclose is stated as *none identified*, never omitted.

D-STANDPOINT

See Section 1. [FILL: restate in one sentence for a reader who skips to Limitations.]

D-NONEXPERT

The author writes from the standpoint declared in Section 1 and is *not* a substitute for a credentialed expert in any discipline this paper touches. [FILL: name the specific disciplines this paper draws on, and the disciplines it explicitly does not claim competence in — see the Standpoint paragraph's "disciplines not claimed" list.]

D-SCOPE

[FILL if EMPIRICAL genre: n, population, sampling method, and the boundary past which findings should not be generalized. Else: not applicable to this genre.]

D-NONCLAIM

[FILL: an explicit "we do NOT claim ..." ledger. List at least the claims a reader might mistakenly infer from the title or abstract that this paper does not make.]

D-AIFILL

See Section 10. [FILL: name specifically which passages, tables, or code were AI-drafted vs. author-verified. Every field is stated explicitly as "none identified", never omitted.]

D-TIER

[FILL: name the single highest tier claimed anywhere in this paper (Table 1) and the one reason it cannot go higher yet.]

D-INDEPENDENCE

[FILL: name the independence class (*I0–I5*: self / same-model AI / same-vendor other model / decorrelated-vendor AI / mechanical or original-record check / external human) of every check this paper's claims received, per claim-card (Section A.1). This paper does not seek, and does not treat as available, any external or institutional validation as a lever that would make its claims more true on its own say-so; an outside reader's input, if used, is optional-level evidence at the independence level it actually reaches, never a certification gate. Same-model self-approval is *I0* and is not counted as an independent check.]

D-DVP-NOT-K2

A decorrelated-vendor AI review pass (DVP) is at most an *I3* route. **DVP $\neq$ K2**: no combination of AI-only checks, however many vendors, raises a claim to the K2 (externally certified) knowledge state (Section C) — only a named, class-5 independent human check does. [FILL: state this paper's actual K-state and the independence class each load-bearing claim reached, or: no claim in this paper is asserted above K1.]

D-LEGAL-NEQ-EPISTEMIC

[FILL, or: none identified.] Any license, permit, certification, or regulatory approval referenced in this paper makes an action lawful; it does not raise this paper's epistemic warrant and does not certify any claim as true.

D-NOT-DIAGNOSTIC

[FILL if health/clinical-adjacent, else: not applicable — this paper makes no health, clinical, or treatment recommendation.]

D-TRANSLATION

[FILL if a Thai-language companion exists: missing / machine / reviewed / verified, per record. Else: not applicable — single-language artifact.]

D-DISSENT-PRESERVED

[FILL: pointer to any dissent or deviation record connected to this paper's claims, or: none recorded to date. A dissent record is never silently deleted by a later draft.]

D-COMPARISON

This paper does not claim priority or precedence over other work. Section 6 answers exactly three questions — which problem this paper solves, by which method, and how the nearest neighbours do it the same or differently (Table 2) — and every neighbour relation is stated as *same*, *different*, or *cited*, never as a priority contest. "Adopted from" is written only where a human instructed the adoption and a Blackbox Note line or decision id names it (Section B).

D-CITATION-UNVERIFIED

[FILL, or: none identified.] Every citation in Section 6 and elsewhere carries a `fetch_status` (FETCHED_VERIFIED / NOT_FETCHED / FETCH_FAILED / MISMATCH / CHALLENGED / SUPERSEDED). Source existence does not, by itself, mean the cited source supports the claim attached to it (metadata verification $\neq$ claim-match verification). Any row without a verified citation card is tiered OPEN, not upgraded on the strength of the citation alone.

D-BLACKBOX-NOTE

This paper carries the mandatory Blackbox Note appendix (Section B, "how this work was made"): the curated verbatim human lines that produced this paper's claims and the cooking log of every transformation applied to them. [FILL: Blackbox Note id(s), e.g. BB-YYYY-MM-DD-NN.]

D-K-STATE

[FILL: state this paper's overall knowledge state (Section C): K0 internal working note, K1 public-provisional (published, independence class named per claim, no class-5 human check yet), K2 exter-

nally certified (a named class-5 human independently checked the load-bearing claims), or K3 superseded/withdrawn. A paper may mix K-states across claims; if so, name the K-state per claim-card row in Table 3 instead of one blanket value.]

D-AUTHORSHIP

See Section 10. The research direction, standpoint, and final public commitment are the human author’s; AI contribution is disclosed per claim (`produced_by`, Table 3) and never substitutes for the author’s own judgment or responsibility (**AIContribution** $\neq$ **EpistemicResponsibility**).

10 AI-assistance disclosure

This paper is a human–AI co-production (disclaimer **D-AUTHORSHIP**, Section 9), not AI-only automation and not human-only authorship. Generative AI assisted with [FILL: e.g. literature scaffolding, drafting, repository/template construction, and review-checklist support]. Per the route-level disclosure standard [Lahtee, 2026c]: **AI output is not treated as evidence**. Every claim above is accepted only when it matches a retained source record or a machine-checkable result described in the Claim Matrix (Section A), which records, per claim, who produced it and who is responsible (`produced_by`, `responsible`). The human holds the standpoint, the conceptual commitment, verification of load-bearing citations, the falsifier judgment, and the final public commitment; AI’s role was assistive (exploration, drafting, structuring, adversarial routes, mechanical checks, logging), never substitutive for the author’s own judgment, standpoint, or final commitment (Human Mastery Gate, Section D; **AIContribution** $\neq$ **EpistemicResponsibility**).

11 Conclusion

[FILL.]

A Claim matrix

Every claim-card id referenced above (^[Cn]) resolves to exactly one row below. No prose claim in the main text may lack a row here; no row here may claim a tier its evidence column does not support. Per Chair Ruling v1 §B2, this compact table is a print-space compression of the full claim card (`claim_card`, `shape: full`); it is not the record of correctness itself — field-presence here is mechanically checkable, the content’s correctness is what the independent check (Q5, Section A.1) exists for.

ID	Informal statement	Evidence / formal support	Tier	Produced by	Responsible
C1	[FILL]	[FILL: source id / theorem name / dataset ref]	[FILL]	[FILL: human / ai / joint]	human
C2	[FILL]	[FILL]	[FILL]	[FILL]	human

Table 3: Claim Matrix (format after Lahtee, 2026c), extended with co-production columns `produced_by/responsible` per Chair Ruling v1 §A3.

A.1 Five-questions detail (per claim)

For every row in Table 3, this sub-table answers the five founder questions the kernel can check for presence but not, beyond Q5, for correctness (Mechanical validity $\neq$ Semantic validity): `seen` (what was observed), `separates` (what the observation distinguishes), `ai_filled` (what AI supplied, never omitted), `assumed`

(what was taken as given), and tested (what independent check it received, named by independence class *I0–I5*).

ID	seen	separates	ai_filled	assumed	tested (indep. level)
C1	[FILL]	[FILL]	[FILL: none identified, or what]	[FILL]	[FILL: I0–I5]
C2	[FILL]	[FILL]	[FILL]	[FILL]	[FILL: I0–I5]

Table 4: Five-questions detail, keyed to Table 3 by ID (S5_anchor Must-fix 1, option (a)).

Full claim card (every field, not just this print compression): [FILL: <repo path>/claims/<claim-id>.claim_card.js (S5_anchor Must-fix 1, option (b))].

B Blackbox Note: how this work was made

(*Thai project term: “Bantuek Klong Dam” / the black-box note.*) This appendix is mandatory (Chair Ruling v1 §A1; disclaimer **D-BLACKBOX-NOTE**). It is a curated subset of the raw human voice record that produced this paper’s claims — selected by the human owner of the voice, verbatim (typos kept), never polished or translated in place — followed by the cooking log of every transformation applied to those lines. The full record is archived separately and cited by id; a line appears here only if removing it would change a claim card.

ID	Timestamp	Role	Kind	Verbatim text	Distinction introduced	Became claim →
BB-YYYY-MM-DD-01	[FILL]	[FILL: founder / practitioner / community-member]	[FILL: question / proposal / correction / ruling]	[FILL: exact words, untranslated]	[FILL]	[FILL: claim-card id / rule id]

Table 5: Blackbox Note — curated verbatim lines (templates/knowledge/blackbox_note.yaml).

Step	By	Input lines	Output	What changed
lens_in	[FILL: human / ai / joint]	[FILL: line n’s]	[FILL: file/claim-card id]	[FILL: one sentence]

Table 6: Cooking log (Thai project term: “karn pung”) — every transformation of the raw lines, append-only.

C Knowledge state

This paper’s overall knowledge state, and the state of each load-bearing claim where it differs from the overall state (disclaimer **D-K-STATE**, Section 9): K0 internal working note, K1 public-provisional, K2 externally certified (requires a named class-5 independent human check — **DVP** ≠ **K2**, disclaimer D-DVP-NOT-K2), or K3 superseded/withdrawn. [FILL: overall K-state, and any per-claim exceptions by claim-card id.]

D Human Mastery Gate

Before submission the author confirms they can defend, without AI assistance, each of the following (adapted from the Standalone Scholar Human Mastery Gate; unresolved items block submission, they do not get silently dropped):

1. the problem
2. the major literature families
3. the closest constructs
4. the precise inadequacy
5. the proposed mechanism
6. the boundary conditions
7. the strongest counterargument
8. the strongest counterexample
9. the falsifying record
10. the discriminating empirical test

Gate status: [FILL: PASS / PASS WITH NAMED GAPS / NOT READY — list gaps].

E Provenance and lineage

This paper is positioned relative to prior work per the anchor-preservation protocol (status vocabulary: PRESERVE_EXACT, PRESERVE_FUNCTION, EXPAND, SUPERSEDE). [FILL: table of inherited mechanisms and their status, or a pointer to lineage/RELATION_TO_STANDALONE_SCHOLAR.md.] Direct ancestor: Lahtee [2026b]. Core epistemic engine this paper’s provenance apparatus is built on: Lahtee [2026a].
